

Your partner in climate responsibility

Lenovo CO₂ Offset Services

Lenovo's CO₂ Offset Service offers a seamless and transparent way to offset the estimated emissions associated with your Lenovo PCs, desktops, or tablets. We've assessed the estimated carbon emissions for the average lifecycle of your device—including manufacturing, daily use, and eventual retirement of your device.

By participating in Lenovo's CO₂ Offset Services, you are directly contributing to a portfolio of climate action projects. Each initiative is vetted and independently verified by the United Nations Clean Development Mechanism (CDM), Climate Action Reserve, and Gold Standard®. This helps ensure that your investment in carbon credits is not only responsible but also contributes to meaningful and verified environmental efforts.

Sah Wind Power Plant

Turkey

Quick overview:

- 01** Certified by Gold Standard®
- 02** Project supports access to affordable, clean energy and promotes economic growth
- 03** Helps avoid approximately **203,000 tonnes of CO₂e** per year¹
- 04** Supports **3** of the 17 SDG goals:
Affordable and Clean Energy | Decent work and economic growth | Climate Action

Challenge

Burning fossil fuels for power generation emits significant greenhouse gases, contributing to global warming and air pollution.

Solution

The Sah Wind Power Plant was established to replace old fossil fuel power plants in the Bandirma and Bursa regions of Turkey. It consists of 35 wind turbines, each with an output of 3.0 MW, and connects to Turkey's national electricity grid via a 35 km transmission line¹.

Impact

This project has played a key role in reducing potential CO₂ emissions in the region and will continue to contribute towards the economic growth² of the area by generating 341.275 MWh of clean energy per year. Additionally, this project has helped build roads around the project area and has provided training and employment opportunities for the local community.

300mw Solar Power Plant

Rajasthan, India

Quick overview:

- 01** Certified by Gold Standard[®]
- 02** Project supports access to affordable, clean energy and promotes economic growth
- 03** Helps avoid approximately **492,000 tonnes of CO₂e** per year¹
- 04** Supports **3** of the 17 SDG goals:
Affordable and Clean Energy | Decent work and economic growth | Climate Action

Challenge

Fossil fuel power plants emit high levels of greenhouse gases, contributing to climate change and environmental degradation.

Solution

The project is a 300 MW solar power plant generates electricity using renewable solar energy. It replaces emissions of greenhouse gases (GHG's) estimated to be approximately 693,327 tCO₂e per annum, thereby displacing 741,845 MWh/year amount of electricity from the generation-mix of power plants connected to the Indian electricity grid².

Impact

Generates 900,443.59 MWh of renewable energy annually, the project reduces fossil fuel reliance, helps reduce GHG emissions, and creates employment opportunities, promoting solar technology development in India².

Lenovo

Ascend Performance Materials N2O Abatement Project

Florida, USA

Quick overview:

01 Certified by Climate Action Reserve

02 Helps avoid approximately **2.2 million tonnes of CO₂e** per year¹

Challenge

Nitrous Oxide (N₂O) is a potent, unregulated greenhouse gas with a global warming potential 265 times² that of CO₂ and is normally generated as a waste product at the project site.

Solution

The Florida N₂O Abatement project is the largest voluntary N₂O abatement initiative in North America, converting waste N₂O from the adipic acid process into less harmful substances. Phase I of the project helped with the installation of an absorption column that will convert NO_x to nitric acid via a high-pressure water absorption process. This absorption column will allow the Thermal Reduction Unit (TRU) to accept a higher percentage of the flow from the adipic acid plant, resulting in a higher quantity of N₂O destroyed. In 2023 Phase II of the project installed a new control device to effectively destroy both N₂O and NO_x and provide reliability to maintain the highest possible level of N₂O destruction³.

Impact

This project helps to permanently destroy N₂O emitted into the atmosphere.

Lenovo

West Huaybong 3 Wind Farm

Thailand

Quick overview:

- 01** Certified by UN Clean Development Mechanism
- 02** Project supports access to affordable and clean energy
- 03** Helps avoid approximately **139,035 metric tonnes of CO₂e** per year¹

Challenge

Over 90% of electricity consumed in Thailand's grid is supplied by fossil fuels based power plants, resulting in significant greenhouse gas emissions.

Solution

This Wind Farm project is located in Nakhon Ratchasima Province in northeast Thailand comprises of 45 turbines with a total installed capacity of 2.3 MW. This Wind Farm produces clean, renewable energy with no emissions and helps displace the electricity generated from fossil-fuel-based plants. The power produced by the wind farm is distributed to the national Thailand grid and is estimated to generate 232.5 GWh annually.

Impact

This wind farm contributes to Thailand's sustainable development and creates local employment opportunities. The wind farm serves as an example of technology transfer and supports training in concepts relevant to wind turbine equipment and maintenance².
